AS LONG AS THERE IS SODA...

1 TAKE ONE DOWN...

2 PASS IT AROUND.

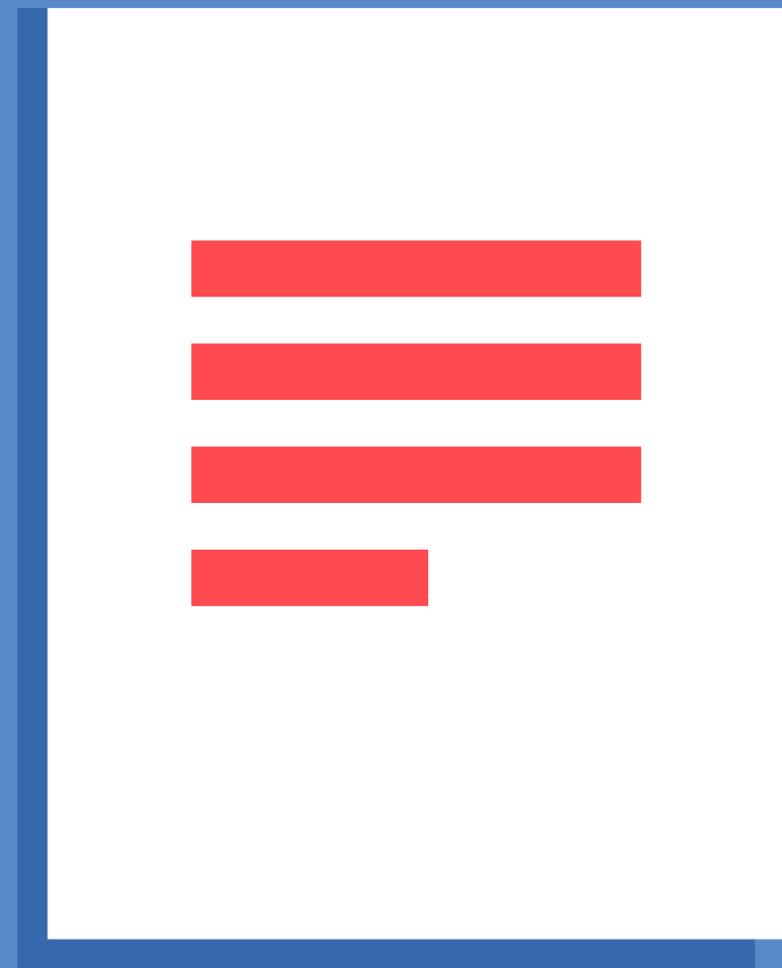

AS PHP...

```
1 while( there_is_soda() ){  
2     take_one_down();  
3     pass_it_around();  
4 }
```

WAIT—DO WE HAVE SODA?

```
1  if( there_is_soda() ){
2      while( there_is_soda() ){
3          take_one_down();
4          pass_it_around();
5      }
6  }
```

SODAS & WORDPRESS POSTS

IN WORDPRESS...

```
1 if( have_posts() ){
2     while( have_posts() ){
3         the_post();
4         the_title;
5         the_content;
6     }
7 }
```

IN WORDPRESS...

```
1 if( have_posts() ){  
2   while( have_posts() ){  
3     the_post();  
4     the_title;  
5     the_content;  
6   }  
7 }
```

TAKE ONE
DOWN...

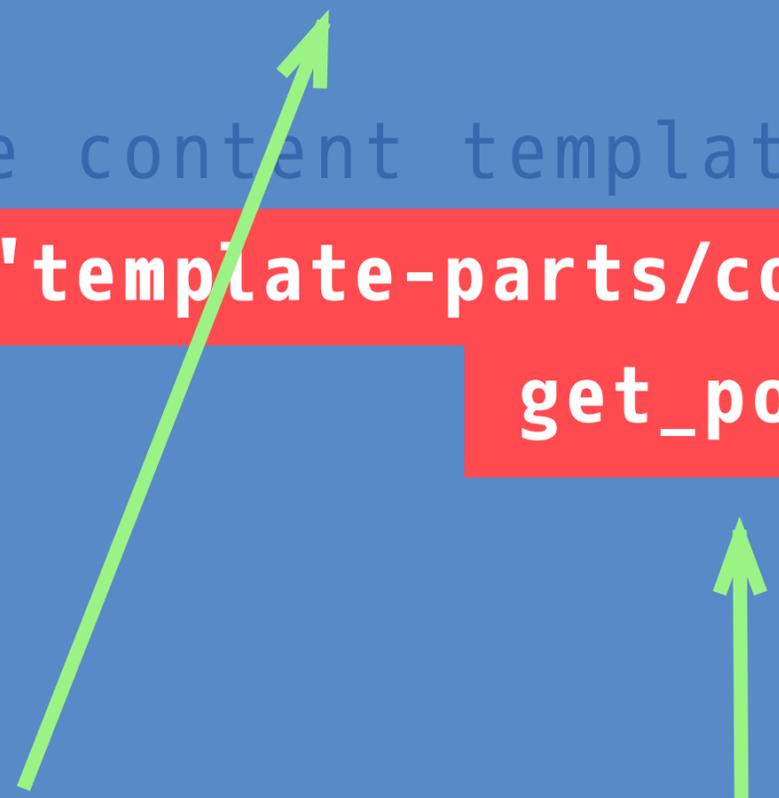

PASS IT
AROUND.

2016 THEME LOOP — INDEX.PHP

```
1 // Start the loop.
2 while ( have_posts() ) : the_post();
3
4 // Include the page content template.
5 get_template_part( 'template-parts/content',
6                   get_post_format() );
7
8 // End of the loop.
9 endwhile;
```

2016 THEME LOOP — INDEX.PHP

```
1 // Start the loop.
2 while ( have_posts() ) : the_post();
3
4 // Include the page content template.
5 get_template_part( 'template-parts/content',
6 get_post_format() );
7
8 // End of the loop.
9 endwhile;
```

TAKE ONE
DOWN...

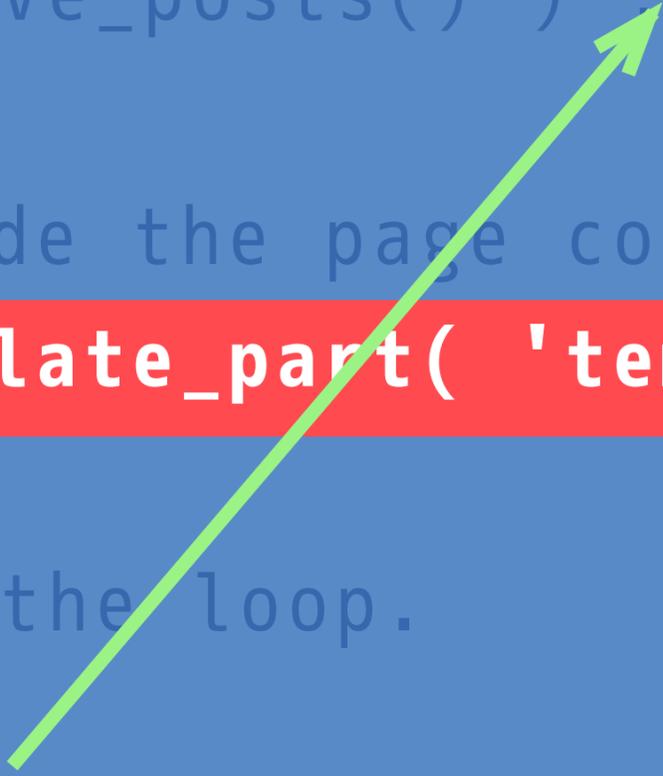

PASS IT
AROUND.

2016 THEME LOOP — PAGE.PHP

```
1 // Start the loop.
2 while( have_posts() ) : the_post();
3
4 // Include the page content template.
5 get_template_part( 'template-parts/content',
6                   'page' );
7
8 // End of the loop.
9 endwhile;
```

2016 THEME LOOP — PAGE.PHP

```
1 // Start the loop.
2 while ( have_posts() ) : the_post();
3
4 // Include the page content template.
5 get_template_part( 'template-parts/content', 'page
6
7 // End of the loop.
8 endwhile;
```

A green arrow originates from the `endwhile;` line (line 8) and points diagonally upwards and to the right towards the `the_post();` line (line 2). Another green arrow originates from the text 'TAKE ONE DOWN...' and points diagonally upwards and to the right towards the `get_template_part` line (line 5).

TAKE ONE DOWN...

PASS IT AROUND.

WAIT...

ARE THEY BASICALLY
THE SAME?

BY GEORGE!

Yes, **all** Wordpress **loops** are essentially the **same**.

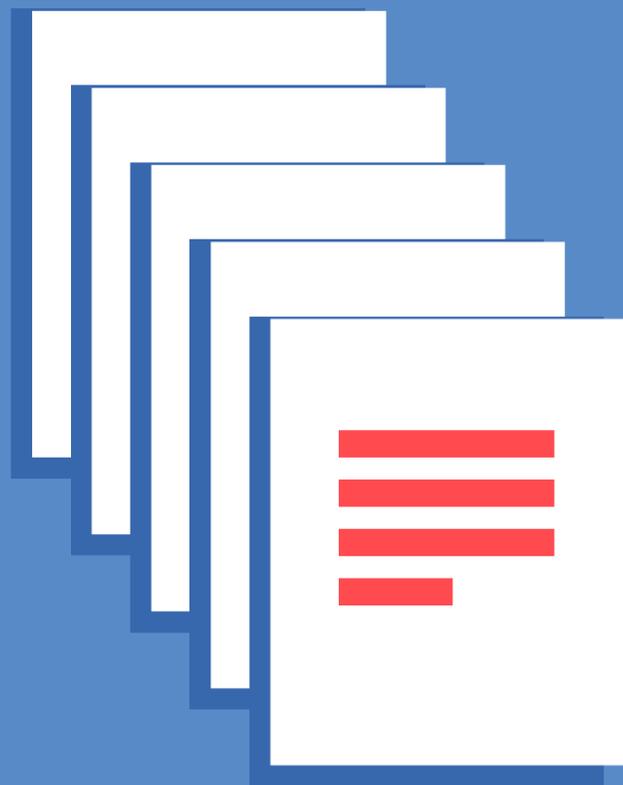

The difference is how you **pass it around**.

BUT...

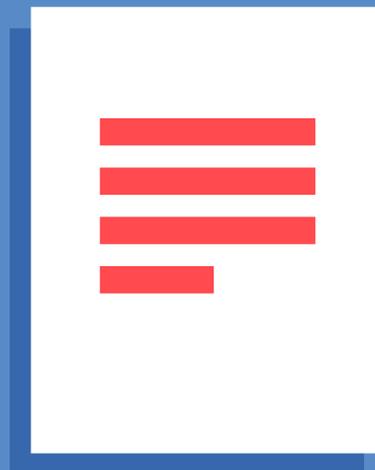

WHY IS ONE A LIST
AND THE OTHER JUST
ONE PAGE?

LOOP > INDEX.PHP

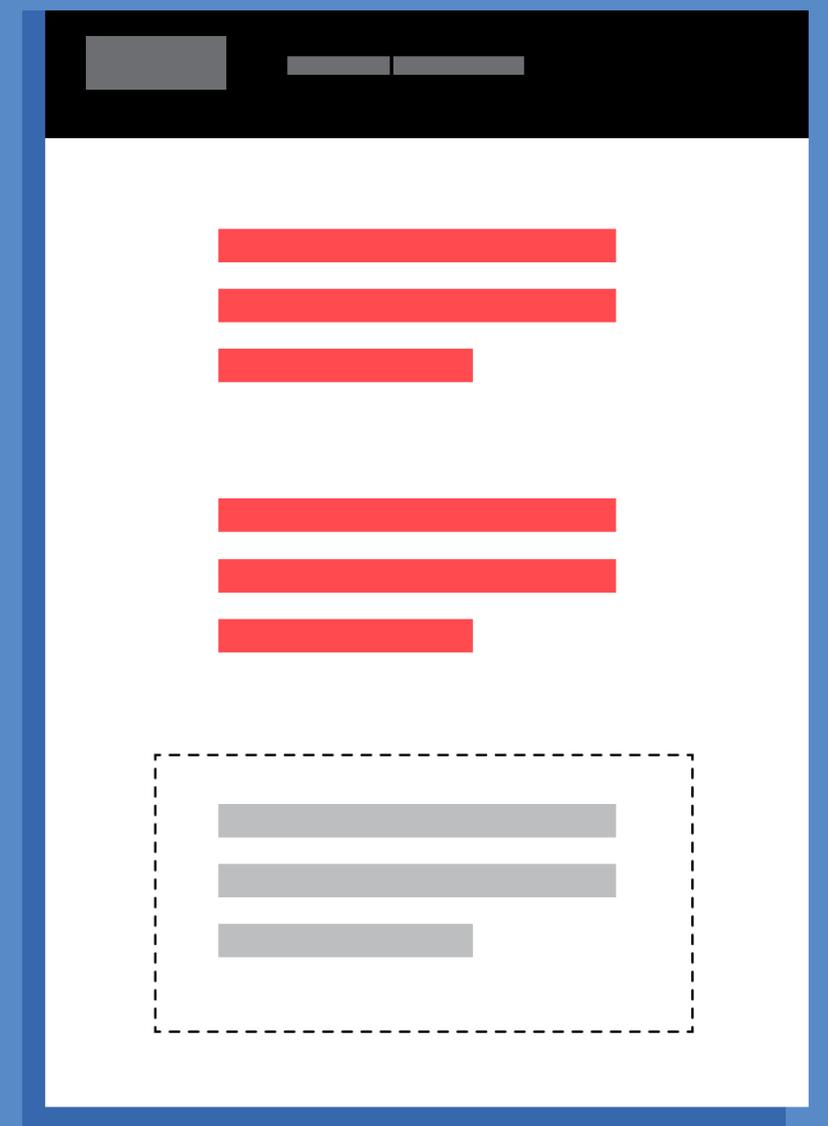

Posts

The Loop

Web Page

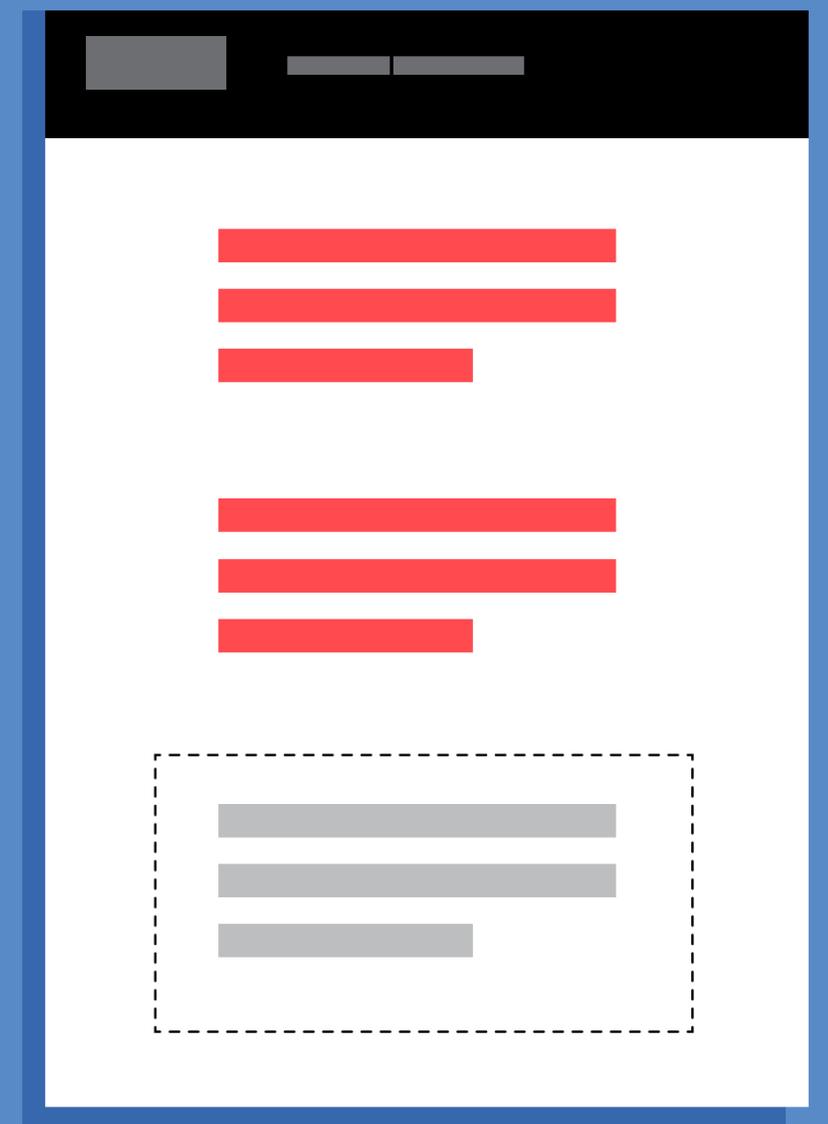

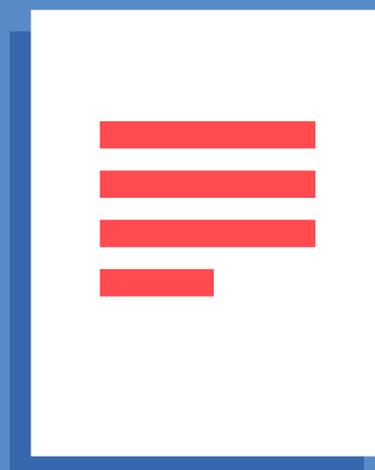

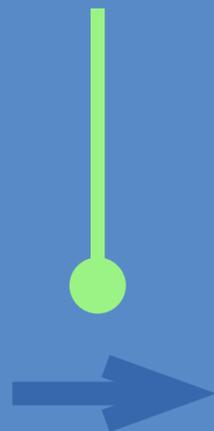

LOOP > INDEX.PHP

Posts

The Loop

Web Page

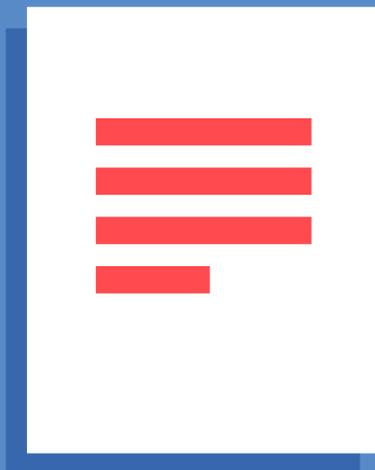

TAKE ONE DOWN...

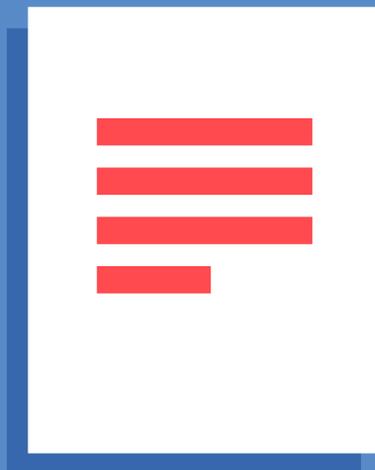

PASS IT AROUND.

LOOP > PAGE.PHP

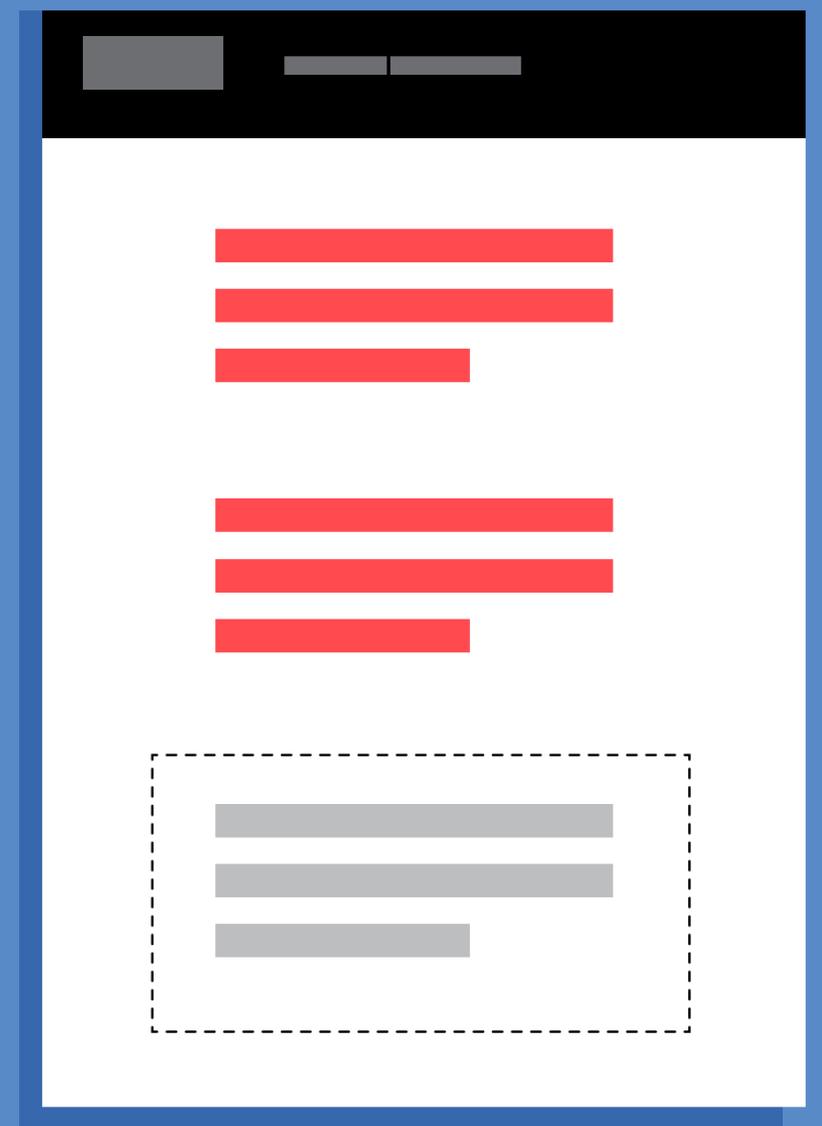

Posts

The Loop

Web Page

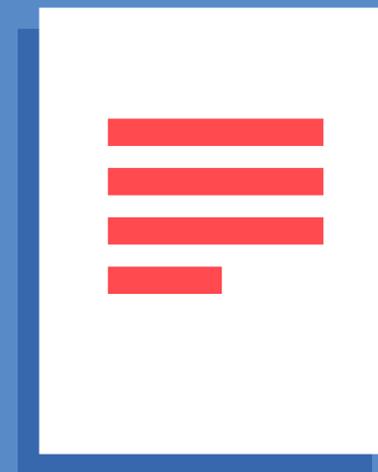

NO. OF POSTS CHANGES

index.php

VS.

page.php

INVISIBLE VARIABLE: \$WP_QUERY

Every URL loads with a variable called **\$wp_query**.

It **changes** based on what you're looking at.

`$WP_QUERY > INDEX.PHP`

`WP_Query()` → `$wp_query`

I want...

- posts
- 10 of them
- newest first

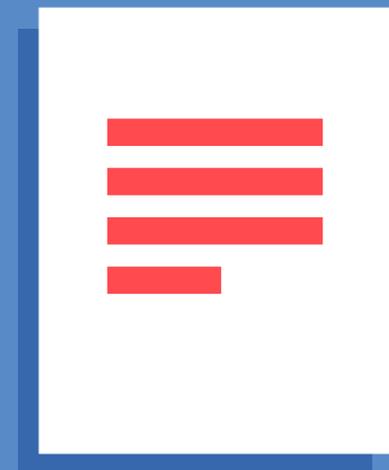

`$WP_QUERY > PAGE.PHP`

`WP_Query()` → `$wp_query`

I want...

- page
- 1 of them
- slug is "about"

POWER UP!

We can use **WP_Query()** to make our own queries.

We can query on **just about anything** we want to.

NEW WP_QUERY — SOME_TEMPLATE.PHP

```
1 $my_posts = new WP_Query(array(  
2     'post_type'           => 'post',  
3     'posts_per_page'     => 10,  
4     'order'               => 'DESC',  
5 ));
```

NEW WP_QUERY — SOME_TEMPLATE.PHP

```
1 $my_posts = new WP_Query(array(  
2     'post_type'           => 'post',  
3     'posts_per_page'     => 10,  
4     'order'              => 'DESC',  
5 ));
```

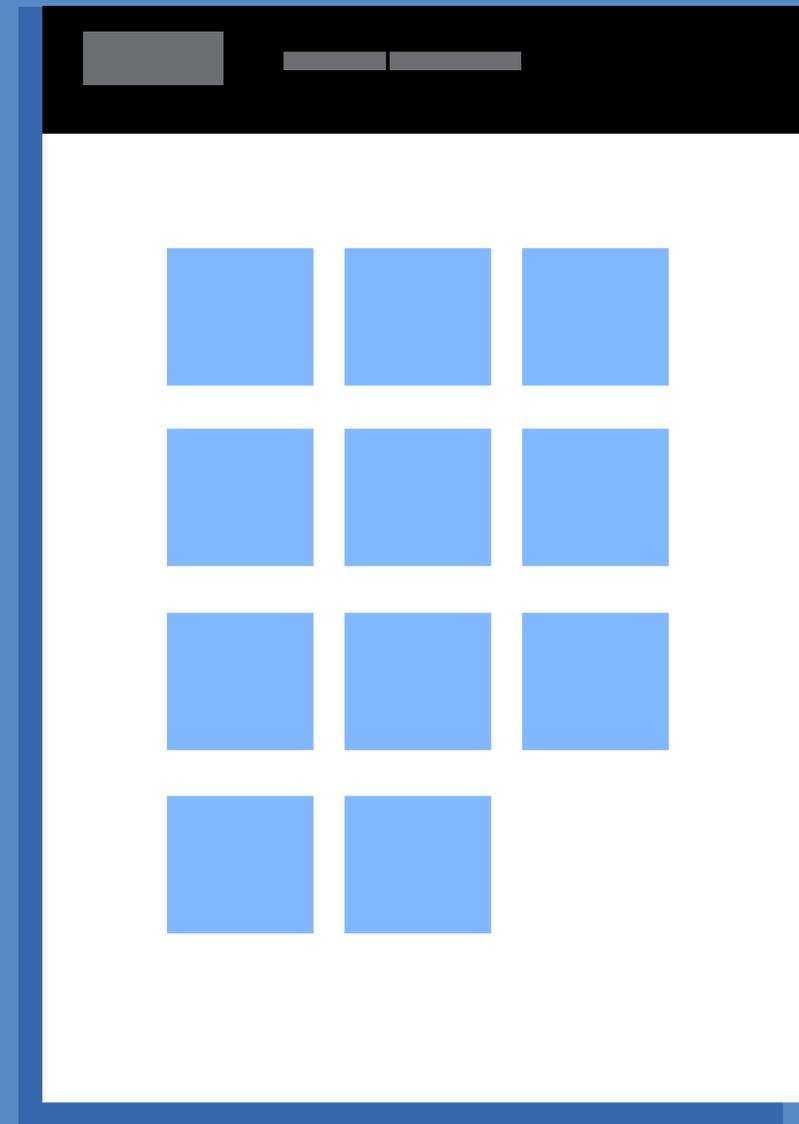

\$WP_QUERY LOOP — SOME_TEMPLATE.PHP

```
1 if( $my_posts->have_posts() ){
2     while( $my_posts->have_posts() ){
3         $my_posts->the_post();
4         the_title();
5         the_content();
6     }
7 }
```

EX 1 – LIST OF “EMPLOYEES”

I want...

- Employees
- All of them
- By last name

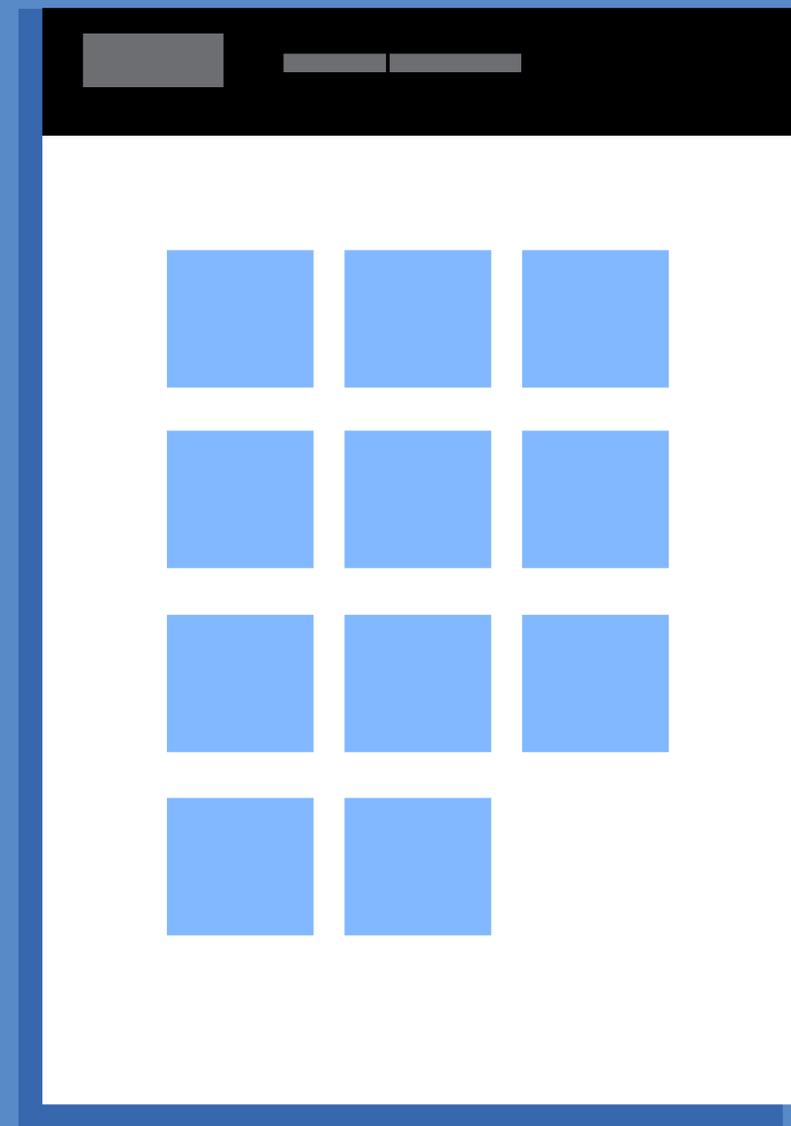

EX 1-CODE

```
1 $employees = new WP_Query(array(  
2     'post_type'           => 'employee',  
3     'post_per_page'      => -1,  
4     'orderby'            => 'meta_value',  
5     'meta_key'           => 'last_name',  
6 ));  
7  
8 // Loop through $employees...
```

EX 2 – UPCOMING EVENTS

I want...

- Events
- 5 next
- Remove past events

EX 2-CODE

```
1 $events = new WP_Query(array(  
2     'post_type'           => 'event',  
3     'posts_per_page'     => 8,  
4     'order'              => 'ASC', // soonest first  
5     'orderby'            => 'meta_value',  
6     'meta_query'       => ( see next slide! )  
7 );  
8  
9 // Loop through $events
```

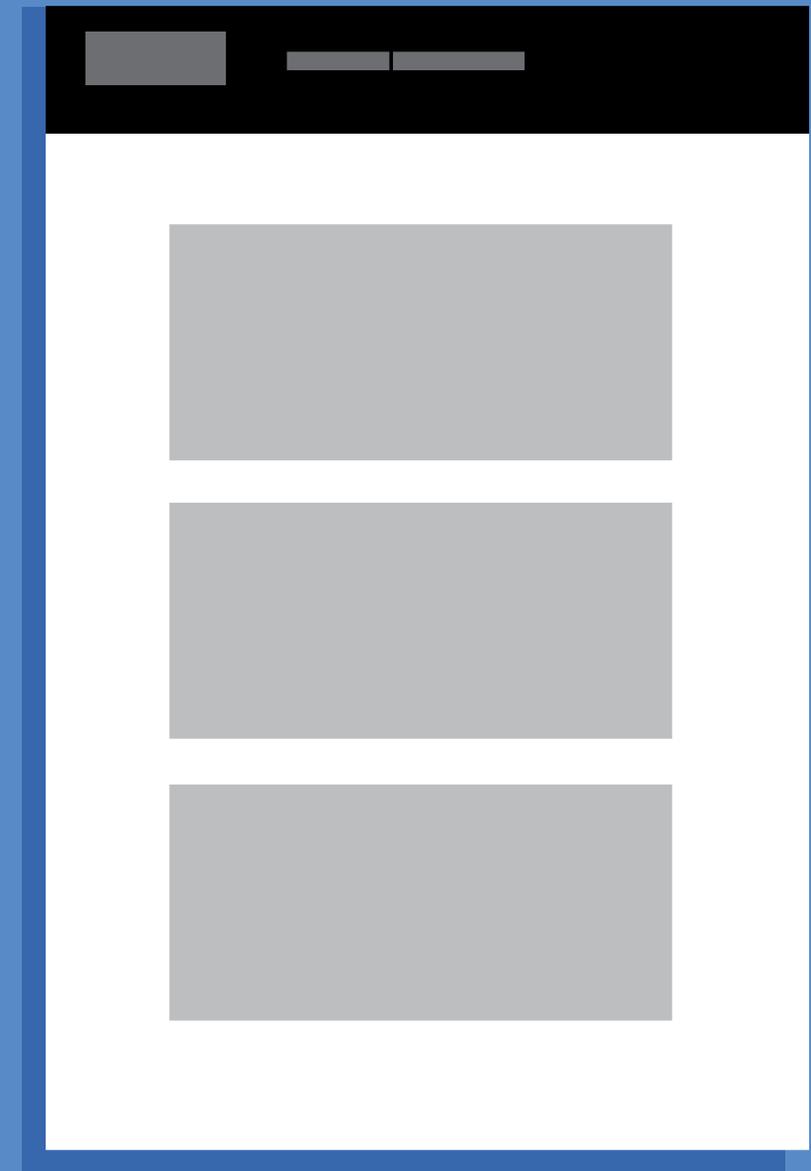

EX 2-CODE, META_QUERY

```
1 $events = new WP_Query(array(
2     ...
3     'meta_query' => array(
4         array(
5             'key' => 'event_date',
6             'compare' => '>=',
7             'value' => date('Ymd'),
8             'type' => 'DATETIME'
9         ),
10    ),
11 );
12 // Loop through $events
```

EX 3 – MULTIPLE LOOPS

I want...

- Tagged = Davis
- Posts
- Deals (custom post type)
- Reviews (custom post type)

EX 3-CODE

```
1 $posts = new WP_Query(array(  
2     'post_type' => 'post', 'tag' => 'davis',  
3 );  
4 // loop through $posts;  
5 wp_reset_postdata();
```

wp_reset_postdata() resets the invisible variable **\$post** back to the default set by Wordpress the the URL loads—yeah, there's another invisible one..

EX 3-CODE CONT.

```
7 $reviews = new WP_Query(array(
8   'post_type' => 'reviews', 'tag' => 'davis',
9 );
10 // loop through $reviews
11 wp_reset_postdata();
12
13 $deal = new WP_Query(array(
14   'post_type' => 'deals', 'tag' => 'davis',
15   'meta_query' => array(...),
16 );
17 // loop through $deals;
18 wp_reset_postdata();
```

!!! WARNING !!!

Using the name **\$wp_query**
may make you *punch yourself
in the face.*

```
1 $wp_posts = new WP_Query();
```

USE \$TEMP INSTEAD

```
1 // Set aside the default $wp_query
2 $temp = $wp_query;
3
4 // make your query
5 $wp_query = new WP_Query($args);
6
7 // restore original query
8 $wp_query = $temp;
```
